

Angola: Sustained Drought Crisis with 10-Month Worsening Trend

Angola is experiencing a persistent drought-driven humanitarian crisis that has been intensifying for 10 consecutive months—the longest sustained worsening trend globally. The country's INFORM severity score currently stands at 6.6 (High), with crisis drivers explicitly identified as "Drought/drier conditions."

The Drought Trajectory

Angola's crisis follows a distinctive pattern. After improving through mid-2024 (severity dropped from 3.2 to 2.7 between January and November), conditions reversed sharply. Starting in February 2025, severity began climbing steadily, marking 10 consecutive months of increasing trend through April 2026. This makes Angola one of only two countries globally with 6+ months of sustained deterioration—the other being Mexico with 7 months.

The severity score doubled from 3.3 to 6.6 between December 2025 and January 2026, though this reflects the INFORM methodology rescaling rather than a genuine doubling of crisis intensity.

Minimal Humanitarian Response

Despite the escalating crisis, Angola has only a Regional DRC Refugee Response Plan (RDRC_RRP25) with \$20.2M in requirements for 2025—receiving just 3% funding (\$0.6M). The plan is classified as Tier 4 (adequately resourced) with a low gap score of 0.209, but this reflects the plan's narrow scope (refugee response) rather than the broader drought crisis affecting the country.

Critically, the plan has no recorded people-in-need figure and a very low operating environment score of 3.0, suggesting relatively good access conditions. This indicates the drought crisis is not being addressed through formal humanitarian response plans tracked in this dataset.

Regional Context: Southern Africa Drought Belt

Angola sits within a broader Southern African drought corridor. Regional comparison shows:

- **DRC** (9.0 severity, Very High): Most severe in region, 22 months at High+, structurally neglected
- **Mozambique** (7.5 severity, High): Three 2025 flash appeals totaling \$682.7M with 13-35% funding, Tier 3 plans
- **Zimbabwe** (7.1 severity, High): 21 months at High+, structurally neglected
- **Angola** (6.6 severity, High): 10 months increasing, 14 months at High+
- **Zambia** (6.4 severity, High): 20 months at High+, structurally neglected

Mozambique received substantial humanitarian planning attention with multiple flash appeals in 2025, while Angola's drought appears to be unaddressed by formal response mechanisms.

Key Concerns

1. **Unaddressed crisis:** The sustained 10-month worsening trend suggests a growing emergency without commensurate humanitarian response planning
2. **Drought persistence:** Crisis drivers have remained "Drought/drier conditions" since at least April 2025, indicating a protracted climate-driven emergency
3. **Regional pattern:** Angola is part of a broader Southern African drought belt affecting multiple countries, but lacks the formal response plans seen in neighbors like Mozambique
4. **Not yet chronic neglect:** While concerning, Angola has spent 14 of the last 24 months at High+ severity—below the 18-month threshold for structural neglect classification

Angola represents an emerging crisis that may be falling through the cracks of formal humanitarian response systems despite clear and sustained deterioration.
