

Key Outlier Entities and Patterns

The dataset reveals several striking outliers across multiple dimensions—from extreme funding gaps to contradictory signals and dramatic temporal shifts.

1. Most Overlooked Plans: Extreme Gap Scores

Lebanon's Regional Syria Response (RSYR25) stands out as the single most overlooked plan with a gap score of **0.609**, receiving only **9% funding** despite a \$3 billion requirement and an \$2.7 billion gap. This is followed closely by DRC (0.602), Yemen (0.595), and Myanmar (0.568)—all Tier 1 plans with structural neglect flags and extreme operating environment constraints (8.5-10.0 scores).

Potential causes: These outliers share common characteristics—all are structurally neglected crises (22+ months at High+ severity in the last 24 months), face extreme access constraints, and operate in complex conflict environments. The combination of chronic crisis fatigue, operational difficulty, and competing emergencies likely drives donor disengagement.

Top 15 Most Overlooked Plans (2024-2025)						
Country	Plan	Year	Gap Score	Funded %	Gap (\$M)	Op Env
Lebanon	RSYR25	2,025	0.61	9.0		8.5
DRC	HCOD25	2,025	0.60	27.0		9.5
Yemen	HYEM25	2,025	0.60	29.0		10.0
Myanmar	HMMR25b	2,025	0.57	18.0		10.0
Ethiopia	HETH24	2,024	0.54	31.0		10.0
Sudan	HSDN25	2,025	0.54	40.0		10.0
Haiti	HHTI25	2,025	0.54	28.0		8.5
Colombia	HCOL25	2,025	0.53	27.0		8.0

2. Overfunded Small Plans: Coverage Outliers

On the opposite extreme, several small plans received **over 150% of their requirements**. Djibouti's Rohingya response (RRHOAY24) reached **157% funding** on just \$8M requirements, while Nepal (ONPL24) hit **155%** and Kenya (RRHOAY24) reached **153%**. Madagascar's flash appeal (FMDG24) achieved **135% funding** (\$121M received on \$90M ask).

Potential causes: These are typically small-scale, time-bound responses (flash appeals or "Other" plan types) with clear, achievable objectives. Donors may over-commit to demonstrate responsiveness, or unattributed funding gets allocated post-hoc. The small absolute amounts make over-funding less consequential.

3. Contradictory Signals: High Severity but Well-Funded

Palestine (FPSE24) and **Ukraine (HUKR24)** are notable outliers—both face extreme operating environments (10.0 scores) and Very High/High severity, yet achieved **84%** and **76%** funding respectively. Sudan 2024 (HSDN24) similarly reached **71% funding** despite a 10.0 operating environment score and 0.96 severity.

Potential causes: High geopolitical visibility and media attention drive donor engagement despite operational challenges. Ukraine benefits from European proximity and strategic importance; Palestine from longstanding international focus. These crises attract funding even when delivery is difficult.

4. Dramatic Temporal Shifts: Funding Collapses

Kenya's Rohingya response (RRHOAY) experienced the most dramatic collapse—from **153% funding in 2024 to just 5% in 2025**, a **-148 percentage point drop**. Sudan's humanitarian plan (HSDN) fell from **71% to 40%** (-31 points) despite requirements surging from \$2.7B to \$4.2B. Colombia (HCOL) dropped from **62% to 27%** (-35 points), and Uganda's DRC refugee response fell from **69% to 30%** (-39 points).

Potential causes: Donor fatigue for protracted crises, shifting geopolitical priorities (Ukraine, Gaza), and competition for limited humanitarian budgets. Small refugee response plans appear particularly vulnerable to funding volatility.

5. Invisible Crisis: Mauritania

Mauritania is the highest-severity country (6.1 INFORM score, "High" category) with **no formal humanitarian response plan** in 2024-2026. The crisis is driven by drought, floods, and international displacement, with an **Increasing** trend.

Potential causes: Lack of international attention, limited humanitarian presence, or government reluctance to formalize a response plan. This represents a "hidden" crisis where need exists but no coordinated funding mechanism has been established.

6. Efficiency Outliers: Extreme Cost-Per-Person

Myanmar's humanitarian plans show the highest cost-per-person ratios—**\$581 per person in need** for HMMR25b and **\$508** for HMMR24. This is dramatically higher than typical humanitarian responses.

Potential causes: Myanmar's 10.0 operating environment score reflects extreme access constraints post-coup. High costs likely stem from security risks, limited access requiring expensive workarounds (airlifts, cross-border operations), and the need for intermediaries. The extreme operating environment makes every dollar of aid more expensive to deliver.

7. Severely Underfunded Large Plans

Ethiopia's regional refugee response (RETHKENUGA24) received only **2% funding** on \$245M requirements, leaving a \$240M gap. Uganda's 2025 refugee response (RETHKENUGA25) fared only slightly better at **3%** on \$330M. Turkey's Syria response (RSYR25) received just **6%** on \$741M requirements.

Potential causes: Regional refugee response plans appear systematically underfunded compared to in-country humanitarian plans. Donors may prioritize direct country operations over regional coordination mechanisms, or view refugee hosting as a national rather than international responsibility.

Summary of Outlier Patterns

The outliers cluster around several themes: **chronic neglect** (Lebanon, DRC, Yemen, Myanmar with 20+ months at high severity), **funding volatility** (Kenya, Sudan, Colombia with 30+ point drops), **invisible crises** (Mauritania with no plan despite high severity), **contradictory visibility** (Palestine, Ukraine well-funded despite extreme constraints), and **structural underfunding** (regional refugee responses at 2-6% coverage). These patterns suggest systematic biases in humanitarian funding allocation driven by media attention, donor fatigue, and plan type rather than purely by need or severity.
